Researchers at Purdue University have developed a new variable valve actuation device for diesel engines. There remains an unmet need to improve aftertreatment warm-up performance in diesel engines at high-speed idle operation. Regulations for diesel engines are ever more pertinent in the wake of environmental challenges; however, current exhaust gas heaters and burner for diesel engine control are typically unable to meet this need as they are often expensive and inaccurate. Purdue researchers have developed a cost effective, state-of-the-art actuator that provides enhanced thermal calibration. This technique reduces the time for particulate matter (PM) oxidation significantly as compared to current equipment and allows engine idle speeds all the way up to 1,200 RPM after warm-up while still meeting the latest emission standards.

Advantages:

- Efficient
- Accurate
- Reliable

Potential Applications:

- Diesel Engines
- Engine management

People:

- Shaver, Gregory Matthew (Project leader)
- Joshi, Mrunal
- Vos, Kalen

Intellectual Property:

Application Date: March 30, 2021

Type: Utility Patent

Country of Filing: United States

Patent Number: (None)

Issue Date: (None)

Application Date: March 30, 2020

Type: Provisional-Patent

Country of Filing: United States

Patent Number: (None)

Issue Date: (None)
